ref. **Covid-19-Crisis: Many possible causes, various assumptions, numerous trials with patients and different strategies to cope with the epidemic**

Dear Sir or Madam

As you may learn from the new document by John Rappoport, cases of the alleged Covid-19 pandemic are identified by means of tests, which, according of the information of its producers, allone cannot demonstrate a Covid-19 infection so that it has to be confirmes by clinical data, without approving that Covid-19 is the cause of the occurring illness, as various, bacterial, viral and parasitic agents of lung-inflammations may induce a positive test result. Even as nowadays clinical data of patients are often not available, day by day numbers of newly infected persons,won by these tests are presented in major media to underline a devastating world-wide pandemic.

<https://blog.nomorefakenews.com/2020/04/08/corona-creating-illusion-of-pandemic-through-diagnostic-test/>

The entities detected by PCR tests, which are presented in colourful computer-graphics as Covid-19 viruses, are not clearly defined viruses, but more likely parts from so-called exosomes, which show the same size, the same receptors and also RNA as defined to be characteristic for viruses. These packs of substances, termed as exosomes which are normaly built in cells, are built in higher numbers, when the organism has to deal with stressors such as bacterial toxins, heavy metals, chemical substances, hurts, psychic stress and electro-magnetic or nuclear radiation. They emit signals with information on its ingredients to distant cells, to which they hand over its ingredients, for its dissolution respectively for the building of new cells, or budd out of cells and the body, informing via micro-emissions members of similar specia on the internal situation of immunity and metabolism. Samples of tissue or of saliva, analyzed by the PCR-method may give a distant image on the metabolism, nutrition habits, environmental conditions and health problems of a person, that can be loads of antibiotics, heavy metals or micro-dust in Wuhan (China) or in Milan (Italy), which get into nutrients and may cause chronic diseases, or

can be a high, repeated daily consumption of alcohol which has led to the severe course of lung-infections after ski holidays in Ischgl (Austria). Infections by viruses of animal origin, which via meat have passed over to humans, may be another factor.

In this regard, it is well understood, that mainly elderly persons with chronic diseases, who take immune suppressive medications and do not get targeted treatment for their diminishing defence capacity, show a severe course of pulmonary infections occurring with flues such as Covid-19. The so-called Corona pandemic in this way reveals how many people in the world today show immune deficiencies. In this situation covid-19 tests give a non accurate image of such pathogenic factors and invite thereby to Don-Quijoterias of any kind. Together with clinical data, that often are not obtained, they may only detect an acute flue-illness of any origin when it happens.

Starting with only 150 cases found by such measurements outside of China on the 25th January, it was no sleight of hand for leaders such as Bill Gates to declare together with the WHO a global emergency on the 30th January at the World Economic Forum in Davos, interrupting immediately the trade with China and bringing the lockdown to countries all over the world, liquidating thereby small business and self-employment and causing unemployment and famine in many developed and developing countries.

Whilst there are various hypotheses on the causes of the Covid-19 crisis there is a common sense about the role of pre-existing diseases such as chronic pulmonary disorders, diabetes, high blood pressure and cardiovascular diseases for a severe course of the illness, that make hospitalisation necessary.

Numerous trials with various substances, carried out to find an effective Covid-19 treatment, have already got permissions for administration of old

and new medicaments in tests with Covid-19 patients or for regular administration in treatment. The rating of its effects showed many insufficient results and open questions in a first overview.

As new studies reveal a high number of Covid-19 patients die from pulmonary embolism, which can be prevented by means of a blood thinner such as Clexane, that could be administrated via injection at home.

Different views exist on a successful strategy to cope with the Covid-19 epidemic. Whereas one side (Germany, Austria and Switzerland) sees a total lockdown with strict quarantine measures and contact tracing as the only mean to dam the epidemic, the other side (for example Sweden) did not install a general lockdown, so that the industry, institutions, shops and restaurants remained open, and only professional schools and universities were closed and only certain retirement homes received visiting bans, whilst the public received detailed information, how to protect elderly persons with chronic illnesses by respecting rules such as: the distance and hygiene rules in the public and everyone having flue symptoms, to stay at home for two weeks.

With the proclamation of the number of positiv testes persons, termed as «the newly infected» in the TV-news, there is now also a proclamation of the number of the recovered, of which we do not know, on what basis it is found, and whether it comes from antibody tests made.

The transmission of antibodies from recovered to ill persons represents apparently an effective treatment but gamma globulins available on the market today do not contain such antibodies.

With the easing of the lockdown measures in Germany, Austria and Switzerland, we can now see, which strategy on the longer term brings a lesser mortality and a better herd-immunity, which is essential for overcoming a flue-epidemic. At this time it will also become evident, which of the two strategies has more damaging effects on the forthcoming economic development and negativ impact on the life quality of the citicens.

Although the number of new infections already declined in Germanay below one before the intallation of the lockdown on March 23rd, as it can be learned from the numbers of the statal Robert Koch Insitute, and the highest peak of the epidemic in Germany had already been exeeded, as can be learnerd from comparing these data with the ones from earlier epidemics, the German government installed further incisive measures with negative effects for many people in Germany and abroad.

After awating the new seasonal flue-virus from the family of Corona viruses and doing experiments with bats on corona viruses, for its genectic variation in laboratories in Wuhan and elsewhere, it finally turned up, inducing an epidemic in China and in other countries, that now allows tests with old and new substances in ill patients and the development of new medicaments and tests, which in very short time can be released on a

world-wide market. Is there any better situation for big pharma and its researchers?
